

LANCO BIO SEALED

LANCO BIO SEALED is a revolutionary new biosecurity concrete sealant that not only shuts down the capillary system within concrete, but also delivers a powerful antimicrobial to the core of concrete to...

- * Eliminate Salmonella
 - * Eliminate E. Coli
 - * Eliminate Listeria
 - * Eliminate Clostridium
 - * Eliminate mold spores
- ...then blocks their return to concrete

The Problem with Concrete

Although we think concrete is as hard as a rock, it actually is porous like a sponge with millions of microscopic pathways into and through the substrate. Deadly microbes, moisture, and gasses easily penetrate these open capillaries and permeate deep into concrete.

Unfortunately, disinfectants do not penetrate this network of open capillaries and thus cannot reach the microbes safely harbored deep within. Out of reach of chemicals, these microbes thrive and multiply. Worse yet, they will soon return to recontaminate the surface of your concrete.

The LANCO BIO SEALED Solution

LANCO BIO SEALED penetrates the open capillaries in concrete fully eight inches to provide two-step protection. First, LANCO BIO SEALED delivers a powerful antimicrobial agent throughout the core of your concrete which eliminates microbes not just on the surface, but deep within the concrete. Second, LANCO BIO SEALED seals the capillary system shut throughout the concrete to prevent microbes AND moisture from re-entering concrete from any direction.

How LANCO BIO SEALED Works

LANCO BIO SEALED has two key attributes which differentiate it from traditional approaches to concrete biosecurity. First, LANCO BIO SEALED penetrates all the way through most concrete pads—nearly 8 inches—thus the powerful antimicrobial embedded in the product is delivered successfully to ALL microbes lurking deep within your concrete. Traditional disinfectants simply cannot penetrate the capillary system and thus have no effect whatsoever on those microbes that reside deep within concrete. Second, LANCO BIO SEALED hydrates unused Portland naturally present within any concrete to trigger the formation of new cement, thereby sealing the capillary system shut all the way through the concrete, permanently!

This is how LANCO BIO SEALED can say with confidence that it not only stops water ingress and makes concrete stronger, but also stops Salmonella, stops E. Coli, stops Listeria, stops Clostridium, stops Bacillus, and stops mold spores.
